

TERMATE

ENVIRONMENTAL POLICY

Termate actively reduces the effects of its activities on the environment, such as minimising CO2 emissions, recycling materials and provide various recycling waste stream facilities, where possible.

Electricity

We aim to minimise our requirement of electricity from the grid by generating electricity from our own solar panels, investing in low energy lighting, and are introducing a range of other energy reduction initiatives. Any usage from the grid is provided by 100% renewable generation.

Recycling Waste

We are committed to recycling waste, and are currently able to recycle steel, plastic, wood, and food wrappers. All remaining waste materials are sent for energy reclamation. Waste plastic material sacks are sent to be baled, recycled into pellets, and reused. We are also recycling waste material from production to reuse in our manufacturing processes when possible.

Gas

We try to minimise the use of gas throughout the business, which is solely used for heating the premises, any usage is 100% Green Gas.

Legislation

We work to an ISO 14001 based management system, continue to review our impact on the environment and ensure we comply with the new plastic packaging legislation, by minimising our usage of plastic packaging as much as possible.
